

CLINICAL HISTORY

Head injury is the most common cause of death in children and young adults.

EXAMINATION

Head injury is defined as a traumatic injury to the head that results in a temporary or permanent impairment of brain function.

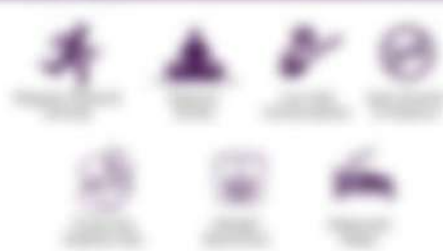

PHYSIOLOGICAL SIGNS

- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.

Head injury is the most common cause of death in children and young adults.

PHYSIOLOGICAL SIGNS

Head injury is the most common cause of death in children and young adults.

SYMPTOMS

- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.

HOW TO PREVENT HEAD INJURY

Head injury is the most common cause of death in children and young adults.

- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.
- Head injury is the most common cause of death in children and young adults.

ADDITIONAL CLINICAL HISTORY

Head injury is the most common cause of death in children and young adults.

Head injury is the most common cause of death in children and young adults.

HEART FAILURE

DEFINITION

- 1. The heart is unable to pump enough blood to meet the needs of the body.
- 2. This can happen in the left ventricle (LVF) or the right ventricle (RVF) or both (biventricular failure).
- 3. It can be caused by a variety of factors, including coronary artery disease, high blood pressure, and heart valve disease.
- 4. It is a common cause of death and disability.

CAUSES

Left ventricular failure

- 1. Coronary artery disease (CAD) - the most common cause.
- 2. High blood pressure (hypertension).
- 3. Heart valve disease (aortic stenosis, mitral regurgitation).
- 4. Heart failure with preserved ejection fraction (HFpEF).
- 5. Heart failure with reduced ejection fraction (HFrEF).
- 6. Heart failure with mid-range ejection fraction (HFmrEF).

Right ventricular failure

- 1. Left ventricular failure (LVF) - the most common cause.
- 2. Heart valve disease (tricuspid regurgitation, pulmonary stenosis).
- 3. Heart failure with preserved ejection fraction (HFpEF).
- 4. Heart failure with reduced ejection fraction (HFrEF).
- 5. Heart failure with mid-range ejection fraction (HFmrEF).

Diagnosis

- 1. Medical history and physical examination.
- 2. Chest X-ray.
- 3. Echocardiogram.
- 4. Blood tests (BNP, troponin, etc.).

HEART FAILURE

Left ventricular failure	Right ventricular failure
• Shortness of breath, especially when lying down or at night.	• Swelling in the legs, ankles, and feet.
• Fatigue and weakness.	• Increased heart rate.
• Rapid weight gain.	• Difficulty breathing.
• Coughing up pink, frothy sputum.	• Dizziness and lightheadedness.
• Nighttime awakenings due to shortness of breath.	• Loss of appetite and weight loss.
• Rapid heart rate.	• Blurred vision.
• Swelling in the lungs.	• Confusion and mental status changes.

HEART FAILURE

HEART FAILURE

DEFINITION AND MANAGEMENT

Left ventricular failure

- 1. Shortness of breath, especially when lying down or at night.
- 2. Fatigue and weakness.
- 3. Rapid weight gain.
- 4. Coughing up pink, frothy sputum.
- 5. Nighttime awakenings due to shortness of breath.
